

ER Modeller Studio

A visual way to see, document, and explain how your Salesforce data fits together

Feature Overview

No coding knowledge required to read this document

What this tool is for

Every Salesforce org is built from objects (Accounts, Contacts, Opportunities, and often many custom ones) that connect to each other in specific ways. Over time, those connections can become hard to see just by looking through Setup. ER Modeller Studio draws them out as a diagram, kept live and accurate to what's actually in the org, so anyone — technical or not — can look at one picture and understand how the data fits together.

Who it's for

- Solution architects and business analysts mapping out a system before or during a project
- Admins documenting how existing objects and automations fit together
- IT and governance teams keeping an accurate, current record of the org's data model
- Anyone who needs to explain “how the data connects” to someone else, without a slide deck built from scratch

What it does

1 Draw your Salesforce data model visually

See how your Accounts, Contacts, Opportunities, and any custom objects connect to each other on one screen, drawn as clean, connected boxes instead of buried in Setup menus. Build a diagram by typing a short, plain description, dragging objects onto the page, or pulling them in automatically from the org.

2 Always based on what's really in your org

Diagrams can be generated directly from your org's real objects and fields, and checked at any time against what's actually there now — so a diagram someone built months ago can be refreshed instead of quietly going out of date.

3 See who can see what, at a glance

A toggle badges every object with its sharing setting — private, shared, or open — for both regular users and any external partner/customer portal users. What normally takes clicking through several Setup pages becomes visible on the diagram itself.

4 Spot which objects actually have data

Another toggle colors each object by whether it holds any records at all. Useful for spring-cleaning a data model, or quickly telling a genuinely active object apart from one nobody ended up using.

5 A searchable dictionary of every object and field

A dedicated, full-screen reference listing every object in the org and, for each one, every field — its description, data type, whether it's required, standard or custom, and how it connects to other objects. Sortable, searchable, and exportable to Excel or CSV — one object at a time, or the entire org in a single

spreadsheet with one tab per object.

6 Export and share diagrams anywhere

Save a diagram as an image for a slide deck or document, or export it in formats that other diagramming tools understand — so it can be pasted into a wiki page, opened for further editing elsewhere, or attached to a project's documentation.

7 Work on several diagrams at once

Diagrams open in tabs, like a browser, so different projects or systems can be modeled side by side without losing track of any of them. Everything is saved inside Salesforce, so it's there the next time anyone opens the tool.

8 Make it feel like your own

Switch between a few different visual themes — light or dark — and the choice is remembered for each person, so it's exactly how they left it the next time they log in, on any device.

9 Respects who's allowed to see what

The tool works within each person's existing Salesforce permissions. It doesn't grant access to anything they couldn't already see, and administrators control who's allowed to use it at all.

Runs entirely inside Salesforce — nothing to install for the people using it, and no data leaves the org.
